The Gauss-Seidel method

Introduction

- In this topic, we will
 - Describe a small change to the Jacobi method
 - Observe that this small change:
 - Results in faster convergence
 - Guarantees convergence for another class of matrices
 - Requires no additional work

2

The Gauss-Seidel method

The Jacobi method

- The Jacobi method approximate the solution to

$$A\mathbf{u} = \mathbf{v}$$
 by iterating

$$\mathbf{u}_{k+1} \leftarrow A_{\text{diag}}^{-1} (\mathbf{v} - A_{\text{off}} \mathbf{u}_k)$$
 - Normally, you think of this as calculating the entire vector

3 

3

The Gauss-Seidel method

The Gauss-Seidel method

- Gauss and Seidel realized that we can calculate the entries of \mathbf{u}_{k+1} one at a time, and to then use this updated entry when calculating the next entry
 - The next approximation begins with

$$\mathbf{u}_{k+1} \leftarrow \mathbf{u}_k$$
 - We then update the i^{th} entry of \mathbf{u}_{k+1} one at a time:

$$\mathbf{u}_{k+1; i} \leftarrow \frac{1}{a_{i,i}} (\mathbf{v}_i - A_{\text{off}; i, \dots} \mathbf{u}_{k+1})$$

where $A_{\text{off}; i, \dots}$ is the i^{th} row of the matrix A_{off}
 - Note that when we calculate $\mathbf{u}_{k+1; 3}$, the first two entries have already been updated

4 

4

The Gauss-Seidel method

- Visually, this is what occurs in solving $A\mathbf{u} = \mathbf{v}$ with the Jacobi method

$$\begin{pmatrix} \circ \\ \circ \\ \circ \\ \circ \\ \circ \\ \circ \end{pmatrix} \leftarrow A_{\text{diag}}^{-1} \left(\mathbf{v} - A_{\text{off}} \begin{pmatrix} \otimes \\ \otimes \\ \otimes \\ \otimes \\ \otimes \\ \otimes \end{pmatrix} \right)$$

\mathbf{u}_{k+1} \mathbf{u}_k

5 

5

The Gauss-Seidel method

- Visually, this is what occurs in solving $A\mathbf{u} = \mathbf{v}$ with the Gauss-Seidel method

$$\begin{pmatrix} \circ \\ \circ \\ \circ \\ \circ \\ \circ \\ \circ \end{pmatrix} \leftarrow A_{\text{diag}}^{-1} \left(\mathbf{v} - A_{\text{off}} \begin{pmatrix} \circ \\ \circ \\ \circ \\ \circ \\ \circ \\ \circ \end{pmatrix} \right) = \begin{pmatrix} \otimes \\ \otimes \\ \otimes \\ \otimes \\ \otimes \\ \otimes \end{pmatrix}$$

\mathbf{u}_{k+1} \mathbf{u}_{k+1} \mathbf{u}_k

6 

6

The Gauss-Seidel method 

The Gauss-Seidel method

- The Gauss-Seidel method continues to converge if the matrix is strictly diagonally dominant
 - It actually speeds up convergence
- Unlike the Jacobi method, the Gauss-Seidel method is also guaranteed to converge if the matrix is symmetric and positive definite
 - Such a matrix has all positive eigenvalues

7 

7

The Gauss-Seidel method 

Implementation

- Suppose we are solving $Au = v$ and u is the current approximation:

```

for k = 1:max_iterations
    u_old = u;

    for i = 1:n
        u(i) = v(i);

        for j = [1:i-1, i+1:n]
            u(i) = u(i) - A(i,j)*u(j);
        end
        This was:
        u(i) = u(i) - a(i,j)*u_old(j);
        u(i) = u(i)/A(i,i);
    end

    if norm( u - u_old ) < eps_step
        return; // returns 'u'
    end
end
      
```

8 

8

The Gauss-Seidel method 

Summary

- Following this topic, you now
 - Have an understanding of the Gauss-Seidel method
 - Understand that we can use more recent vector entries when calculating subsequent vector entries
 - Understand that this allows for much faster convergence
 - Are aware this works for a greater range of matrices at no additional cost
