

E&CE 223

Digital Circuits & Systems

Winter 2004

Lecture Transparencies

(Introduction)

M. Sachdev

Course Information: People

■ Instructor

- M. Sachdev, CEIT 4015, ext. 3370, msachdev@uwaterloo.ca

■ Lab Technologists

- Eric Praetzel, E2 - 2357, E.Praetzel@ece.uwaterloo.ca

■ Teaching Assistants

- Mohammed El Gebaly, mgebaly@vlsi.uwaterloo.ca
- Shahab Ardalan ardalan@vlsi.uwaterloo.ca
- Augustine Dominguez adominguez@engmail.uwaterloo.ca
- Syed Iftekar Ali, sali@engmail.uwaterloo.ca

Course Information: Text

■ Text

- M. Marris Mano, Digital Design (3rd edition); Printice Hall
- Lecture notes are at (<http://ece.uwaterloo.ca/~msachdev>)

■ Laboratory Manual

- download from <http://ece.uwaterloo.ca:80/~ece223/>

■ DC reserves

- M. Marris Mano, Digital Design (3rd edition); Printice Hall

■ Lectures

- **Lectures:** Mon, Wed, Fri 9.30am - 10.20 am, MC 1085
- **Tutorials:** Tue @10.30 MC4041; Thurs@ 9.30 PHY235; @11.30 RCH 204

Course Information: Labs

■ Labs

- Three afternoons; 1.30 - 4.20; E2 2363

■ Labs

- **Lab 0 & 1**: individually; **Labs 2, 3** : group of 2
- For labs 2, 3; two 1.5 hr. slots will be available each lab day
- You will be allowed to reserve four 1.5 hr. slots over each schedule lab period, with no more than 2 reservations in a single week. 4 slots include your DEMO period. Reservation is done electronically via Watstar

■ Marks

- **Final exam marks $\geq 50\%$** : Labs 30%, Midterm 20%, Final 50%
- **Final exam marks $< 50\%$** : Labs 0%, Midterm 0%, Final 100%

Coverage of Topics

- **Introduction [1]**

This lecture

- **Number systems [2]**

Radix, radix conversion, complements, subtraction, number representation, codes

- **Boolean algebra & logic circuits [8]**

Boolean algebra, theorems, functions, minterms, maxterms, standard forms, Karnaugh maps, product of sum, sum of products, don't cares, prime implicants, multioutput circuits, Quine-McCluskey method

Coverage of Topics

- **Combinational logic design [8]**

Design constraints, multi-level circuits, common term elimination, XOR circuits, adders & subtractors, iterative design, decoders/encoders, (de)multiplexers, programmed logic devices (ROM, PLA, FPGA)

- **Synchronous sequential circuits [8]**

Sequential circuit types, flip-flops, triggering, analysis & design of clocked sequential circuits, transition design, state reduction, design examples, registers, shift registers, special sequential circuits, timing considerations

- **Asynchronous sequential circuits [8]**

fundamental mode systems with latches, design procedure, races, Moore & Mealy designs, hazards

Relationship to Future Courses

- **This course provides basis for higher order digital system courses**
 - E&CE 222 - Digital Computers
 - E&CE 324 - Microprocessor Systems & Interfacing
 - E&CE 427 - Digital Systems Engineering
 - E&CE 429 - Computer Structures

E&CE223 Assignments

■ Assignments 1

- Mano 1.3, 1.5, 1.6, 1.8, 1.15, 1.17, repeat 1.17 with 1's complements, 1.19, 1.23,

■ Assignment 2

- Mano 2.2, 2.3, 2.6, 2.7, 2.9, 2.11, 2.13, 2.14, 2.19

■ Assignment 3

- Mano 3.2, 3.3, 3.9, 3.10, 3.12, 3.23, 3.27

■ Assignment 4

- Mano 4.1, 4.7, 4.19, 4.28

■ Assignment 5

- 5.15, 5.16, 5.18, 5.24, 5.26, 5.27, 5.28, 5.32, 5.33, 5.34

E&CE223 Assignments

■ Assignment 6

- Mano 6.1, 6.2, 6.4, 6.9, 6.12, 6.21, 6.25

■ Assignment 7

- 7.4, 7.9, 7.17, 7.23, 7.27

■ Assignment 8

- 9.3, 9.5, 9.6, 9.12, 9.15, 9.18, 9.19

- ***Assignment problems and solutions are based on the 2nd edition of the book (see the course website for details)***

Lab and Tutorial Schedule (Tentative)

Week	Dates	Lab	Tutorial
1	Jan 5- 9	---	----
2	Jan 12-16	---	----
3	Jan 19 - 23	Lab0	Ass1
4	Jan 26- 30	Lab0	Ass2
5	Feb 2 - 6	-----	Lab1 Intro
6	Feb 9- 13	Lab1	Ass3
7	Feb 16 - 20	midterm	Ass4/Review
8	Feb 23- 27	Lab1	Ass5
9	Mar 1- Mar 5	Lab1	Lab2 Intro
10	Mar 8- 12	Lab2	Ass6
11	Mar 15 -19	Lab2	Lab3 Intro
12	Mar 22- 26	Lab3	Ass7
13	Mar 29 - 31	Lab3	Ass8

Section 1: Number Systems & Representations

■ Major topics

- Radix
- r 's complements
- $(r-1)$'s complements
- Subtraction using complements
- Binary number representation
- Codes

General Radix Representation

- A decimal number such as 7392 actually represents

- $7392 = 7 \times 10^3 + 3 \times 10^2 + 9 \times 10^1 + 2 \times 10^0$
- $7.392 = 7 \times 10^0 + 3 \times 10^{-1} + 9 \times 10^{-2} + 2 \times 10^{-3}$

- It is practical to write only the coefficients and deduce necessary power of 10s from position

- In general, any radix (base) can be used
- Define coefficients a_i in radix r

$$0 \leq a_i < r$$

$$a_n r^n + a_{n-1} r^{n-1} + \dots + a_0 r^0 + a_{-1} r^{-1} + \dots + a_{-m} r^{-m}$$

- Common radics include $r = 2, 4, 8, 10, 16$

General Radix Representation

r =10 (dec.)	r=2(bin.)	r=8(Octal)	r=16(hex)
00	0000	00	0
01	0001	01	1
02	0010	02	2
03	0011	03	3
04	0100	04	4
05	0101	05	5
06	0110	06	6
07	0111	07	7
08	1000	10	8
09	1001	11	9
10	1010	12	A
11	1011	13	B
12	1100	14	C
13	1101	15	D

14	1110	16	E
15	1111	17	F

■ **Notation**

- Usually shows radix as a subscript

$$(1234.4)_5 = 1 \times 5^3 + 2 \times 5^2 + 3 \times 5^1 + 4 + 4 \times 5^{-1} = (194.8)_{10}$$

$$(F75C.B)_{16} = 15 \times 16^3 + 7 \times 16^2 + 5 \times 16 + 12 + 11 \times 16^{-1}$$

$$= (63,324.6875)_{10}$$

Radix Conversion

- To convert the integral part of a number to radix r , repeatedly divide by r with the reminders becoming the a_i
 - Convert $(77)_{10}$ to binary ($r=2$)

Integer	Remainder	Coefficient
77		
38	1	a_0
19	0	a_1
9	1	a_2
4	1	a_3
2	0	a_4
1	0	a_5
0	1	a_6

■ $(77)_{10} = (1001101)_2$

Radix Conversion

- Convert $(173)_{10}$ to $r = 7$

Integer	Remainder	Coefficient
173		
24	5	a_0
3	3	a_1
0	3	a_2

- $(173)_{10} = (335)_7$

Fraction Conversion

- To convert the fractional part of a number to radix r , repeatedly multiply by r with the integral parts of the products becoming a_i
- Convert $(0.7215)_{10}$ to binary

0.1715×2	$= 1.443$	$a_{-1} = 1$
0.443×2	$= 0.886$	$a_{-2} = 0$
0.886×2	$= 1.772$	$a_{-3} = 1$
0.772×2	$= 1.544$	$a_{-4} = 1$
0.544×2	$= 1.088$	$a_{-5} = 1$
0.088×2	$= 0.176$	$a_{-6} = 0$
0.176×2	$= 0.352$	$a_{-7} = 0$

- $(0.7215)_{10} = (0.1011100 \dots)_2$

Fraction Conversion

- Convert $(0.312)_{10}$ to $r = 7$

0.312×7	$= 2.184$	$a-1 = 2$
0.184×7	$= 1.288$	$a-2 = 1$
0.288×7	$= 2.016$	$a-3 = 2$
0.016×7	$= 0.112$	$a-4 = 0$

- $(0.312)_{10} = (0.2120\dots)_7$

Arithmetic Operations

- **The arithmetic operations of addition, subtraction, multiplication and division can be performed in any radix by using appropriate addition and multiplication tables**
 - Example, $r = 2$

Complements

- In a computer the representation and manipulation of negative numbers is usually performed using *complements*

- Complements for a radix come in two forms

- r's complement
- (r-1)'s complement

+	0	1
0	0	1
1	1	10

X	0	1
0	0	0
1	0	1

- r's complement

- Given a positive number N which has n digit inte-

$$\begin{array}{r}
 1011 \\
 + 101 \\
 \hline
 10000
 \end{array}$$

$$\begin{array}{r}
 1011 \\
 X 101 \\
 \hline
 1011 \\
 000 \\
 1011 \\
 \hline
 110111
 \end{array}$$

ger part, the r 's complement of N is defined as

$r^n - N$ for $N \neq 0$, zero otherwise

Complements

■ 10's Complement

- 10's complement of $(37218)_{10} = 10^5 - 37218 = 62782$
- 10's complement of $(0.12345)_{10} = 10^0 - 0.12345 = 0.87655$

■ 2's Complement

- 2's complement of $(101110)_2 = 2^6 - (101110) = 010010$
- 2's complement of $(0.0110)_2 = 2^0 - (0.0110) = 0.1010$

(r-1)'s Complement

- **Given a positive number N with integer part n bits, fractional part m bits, the (r-1)'s complement is defined as**

$$(r^n - r^{-m} - N) = rr\dots rr.r\dots r - N$$

- **9's complement (r = 10)**

$$9\text{'s complement of } (37218)_{10} = 10^5 - 1 - 37218 = 62781$$

$$9\text{'s complement of } (0.12345)_{10} = (10^0 - 10^{-5} - 0.12345) \\ = 0.99999 - 0.12345 = 0.87654$$

$$9\text{'s complement of } (25.639)_{10} = (10^2 - 10^{-3} - 25.639) = \\ = 99.999 - 25.639 = 74.360$$

$(r-1)$'s Complement

■ 1's complement ($r = 2$)

- 1's complement of $(101100)_2 = 2^6 - 1 - (101100)$
 $= 111111 - 101100 = 010011$
- 1's complement of $(0.0110)_2 = 2^0 - 2^{-4} - (0.0110)$
 $= 0.1111 - 0.0110 = 0.1001$

r's Complement Subtraction

- For positive numbers, A and B the r's complement subtraction (A-B) is performed as follows:

- Add the r's complement of B to A
- If an end carry occurs, ignore it; else take the r's complement of the result and treat it as a negative number
- Proof

$$\text{Let } X = A - B, \quad A \geq 0, B \geq 0$$

$$\text{Let } Y = A + (r^n - B)$$

- (1) If $A \geq B$

$$Y = r^n + (A - B) = r^n + X$$

The r^n is the carry out from (n-1)th (most significant digit). If this carry out (end carry) is discarded, the value of Y is the true positive result X

■ **If** $A < B$

$$Y = r^n - (B - A) = r^n - (-X)$$

Note that $-X$ has a positive value. Hence Y is the r 's complement of the negative of the true value.

QED

■ **10's complement subtraction**

$$A = 72532$$

$$B = 03250$$

$$A' = 27468$$

$$B' = 96750$$

A - B

$$\begin{array}{r} 72532 \\ + 96750 \\ \hline \end{array}$$

$$1\ 69282$$

B - A

$$\begin{array}{r} 03250 \\ + 27468 \\ \hline \end{array}$$

$$30718 \text{ --> } - 69282$$

■ **2's complement subtraction**

$$A = 1010100$$

$$A' = 0101100$$

$$B = 1000100$$

$$B' = 0111100$$

$$A - B$$

$$\begin{array}{r} 1010100 \\ + 0111100 \\ \hline 1\ 0010000 \end{array}$$

$$B - A$$

$$\begin{array}{r} 1000100 \\ + 0101100 \\ \hline 1110000 \end{array} \rightarrow - (0010000)_2$$

(r-1)'s Complement Subtraction

- **For positive numbers A and B the (r -1)'s complement subtraction (A-B) is performed as follows:**

- Add the (r-1)'s complement of B to A
- If an end carry occurs, add 1 to the least significant digit of the result (end-round-carry)
else, take (r-1)'s complement of result and treat it as a negative number
- Proof

$$\text{Let } X = A - B, \quad A \geq 0, B \geq 0$$

$$\text{Let } Y = (A + (r^n - r^{-m}) - B)$$

- **(1) If $A > B$**

$$Y = r^n + (A - B - r^{-m}) = (r^n + X - r^{-m})$$

The r^n is the carry out from (n-1)th (most significant digit). If this carry out is (end carry) is discarded and r^{-m} (one in the least significant digit) is added to the result, the value of Y is the true positive result X

■ **(2) $A = B$**

$$Y = (r^n - r^{-m}) + (A - B) = (r^n - r^{-m})$$

The result is the (r-1)'s complement of the true result zero

■ **(2) $A < B$**

$$Y = (r^n - r^{-m}) - (B - A) = (r^n - r^{-m}) - (-X)$$

Note that (-X) is a positive value. Hence, Y is the (r-1)'s complement of the negative of the true value

QED

■ **9's complement subtraction**

$$A = 72532$$

$$A' = 27467$$

$$B = 03250$$

$$B' = 96749$$

A - B

$$\begin{array}{r}
 72532 \\
 + 96749 \\
 \hline
 1\ 69281 \\
 00001 \\
 \hline
 69282
 \end{array}$$

B - A

$$\begin{array}{r}
 03250 \\
 + 27467 \\
 \hline
 30717 \text{ --> } - 69282
 \end{array}$$

■ **1's complement subtraction**

A = 1010100

A' = 0101011

B = 1000100

B' = 0111011

A - B

$$\begin{array}{r}
 1010100 \\
 + 0111011 \\
 \hline
 1\ 0001111 \\
 0000001 \\
 \hline
 0010000
 \end{array}$$

B - A

$$\begin{array}{r}
 1000100 \\
 + 0101011 \\
 \hline
 1101111 \rightarrow - (0010000)_2
 \end{array}$$

Signed Binary Number Representation

- In most computer applications, integers are represented in a fixed number of bits (fixed format)
 - With n bits, positive numbers from 0 to $2^n - 1$ can be represented

00000	0	01011	11	10110	22
00001	1	01100	12	10111	23
00010	2	01101	13	11000	24
00011	3	01110	14	11001	25
00100	4	01111	15	11010	26
00101	5	10000	16	11011	27
00110	6	10001	17	11100	28
00111	7	10010	18	11101	29
01000	8	10011	19	11110	30
01001	9	10100	20	11111	31
01010	10	10101	21		

Signed Number Representation

- It is often required to represent both positive & negative numbers in the same n-bit format; three common methods
 - Sign & magnitude
 - Signed 1's complement
 - Signed 2's complement

- In all cases, the leftmost bit is the sign: 0 --> positive
1 --> negative
 - All three forms have the same representation for positive numbers

- Sign & magnitude
 - Most significant bit (MSB) is the sign and the rest is the magnitude

- Commonly used for fractional numbers (real, floating point) in computers

■ Signed 1's complement

- The MSB is the sign bit, the rest is
 - the actual value for the positive numbers
 - the 1's complement form for negative numbers
- Has two representations for zero!!
- No longer widely used

■ Signed 2's complement

- The common method of representing signed integers on computers
- Restrict the number range to $(n-1)$ bits. Use 2's complement for negative number representation
 - +M --> M (most significant bit is 0)
 - M --> $2^n - M$ (n-bit 2's complement)

$$= 2^{n-1} + [2^{n-1} - M] = 2^{n-1} + [n-1 \text{ bit } 2\text{'s complement}]$$

- MSB indicates the sign of the number (sign bit)
- Numerical value of a number is given by

$$(-a_{n-1})2^{n-1} + a_{n-2}x2^{n-2} + \dots + a_1x2^1 + a_0xa$$
- With a 5-bit 2's complement number, we can represent the range from -16 to +15

$$00110 \rightarrow (-0)2^4 + 0x2^3 + 1x2^2 + 1x2^1 + 0xa^0 = 6$$

$$10110 \rightarrow (-1)2^4 + 0x2^3 + 1x2^2 + 1x2^1 + 0xa^0 = -10$$

- 5-bit number in 2's complement

10000	-16	11011	-5	00110	6
10001	-15	11100	-4	00111	7
10010	-14	11101	-3	01000	8
10011	-13	11110	-2	01001	9
10100	-12	11111	-1	01010	10
10101	-11	00000	0	01011	11
10110	-10	00001	1	01100	12
10111	-9	00010	2	01101	13
11000	-8	00011	3	01110	14
11001	-7	00100	4	01111	15
11010	-6	00101	5		

Codes

■ **Decimal numbers are coded using binary bit patterns**

- Binary coded decimal (BCD): each decimal digit is represented by a 4-digit binary number; e.g. $(7\ 4\ 3)_{10} = (0111\ 0100\ 0011)_{BCD}$
- Table of various binary codes for decimal digits

decimal	8421 (BCD)	84-2-1	excess-3	2 out of 5	gray
0	0000	0000	0011	00011	0000
1	0001	0111	0100	00101	0001
2	0010	0110	0101	00110	0011
3	0011	0101	0110	01001	0010
4	0100	0100	0111	01010	0110
5	0101	1011	1000	01100	1110
6	0110	1010	1001	10001	1010
7	0111	1001	1010	10010	1011
8	1000	1000	1011	10100	1001
9	1001	1111	1100	11000	1000

- **8421 and 84-2-1 are weighted codes. The latter is convenient for 9's complement operations**
- **Excess-3 is BCD plus 3. It is convenient 9's complement operations**
- **2 out of 5 is useful for error checking (exactly 2 bits are ones)**
- **In Gray code consecutive digits differ only by one bit. Useful for mechanical position decoding.**

ASCII Codes

- **There are several codes for representing textual information in computers. The most common is ASCII (American Standard Code for Information Interchange)**
 - 7 bit code
 - 95 printing characters, 33 control characters
 - Originally designed for punched paper tape and teletypes
